

Fungi For Our Future

“The importance of fungi to the health and welfare of the planet is no longer in any doubt”

Fungi are brilliant at recycling and decomposing and scientists are working to harness this power to help tackle our huge waste problem – including plastic. This is great news for our planet, but we have only discovered a tiny fraction of the fungi that are so important to our eco-system and future. Fungi conservation is more important than ever.

Children from West Park Primary School have worked with herbalist Maria Billington to discover fungi at Boundary Way. Three and four year olds from Madeley Nursery have made drawings and paintings inspired by work by artist Kanj Nicholas.

‘Magnifying Mushrooms’ by the Boundary Way Project explored the importance and beauty of fungi through an innovative programme of creative workshops and work with artists, scientists & plant experts.
